

Texas Hold'em involves a hefty dose of strategy and math. No other poker game draws much on statistics to calculate the odds than Texas Hold'em does. Below are some basic steps to help you with your Texas Hold'em strategy.

Texas Hold'em Strategy – The Concepts Involved

In Texas Hold'em strategy, there are four things you need to consider – the outs, the pot odds, bet odds, implied odds. All these four concepts will help you determine your Texas Hold'em strategy and chances of winning.

The outs in Texas Hold'em strategy are the cards left in the deck. In Texas Hold'em strategy, the pot odds are your chances of raking the pot by computing the current size of the pot and your next call. Bet odds, on the other hand, in Texas Hold'em strategy, are the percentage you get when you analyze the number of players who call a raise. And implied odds in Texas Hold'em strategy are the odds that you get when you assume the result of the betting for the remaining hands.

Texas Hold'em Strategy – Outs and Pot Odds

The most common Texas Hold'em strategy terms you will meet and use are outs and pot odds. These two are the starting point for those who want to learn more about Texas Hold'em strategy. Calculating your odds is a simple case of division. To get your Texas Hold'em strategy, simply divide the number of outs you have, with the number of cards left in the deck. The result would be the Texas Hold'em strategy percentage chance for you to make one of those outs.

At pre-flop, you will be dividing your outs by 50, 47 after the flop, and 46 after the turn. This is how you calculate your Texas Hold'em strategy. So, for example, you have a pocket pair of Jacks but the flop does not show another Jack, to find out your Texas Hold'em strategy and chances of getting a Jack on the turn, you only need to determine your number of outs and the number of cards in the deck. There are two more Jacks of the 47 cards left in the deck. So your Texas Hold'em strategy odds are 2 to 47 or 4.26%.

Pot odds in Texas Hold'em strategy is as easy to compute as outs. Just compare your chance of winning, to the size of the pot, and you should be able to get your Texas Hold'em strategy for pot odds. For example, you are playing a \$5/\$10 pot with Jack-10 facing one opponent on the turn. Your pocket shows a straight draw from a 2/5/9/Q board and you only have one river card left to see if you're going to make it. An 8 or a King will see you through, so your Texas Hold'em strategy for outs is 8 (four 8s and 4 Ks left in the deck) and 46 invisible cards. 8 to 46 are your Texas Hold'em strategy odds, and your only opponent bets \$10. If you bet, you could win \$200, and since \$200 (the size of the pot) divided by \$10 is 20, you have twenty times more chances of winning based on your Texas Hold'em strategy. Your Texas Hold'em strategy for pot odds say that it isn't a bad idea to call.
